

Metabolic Syndrome

BY: BROOKE EAGAN

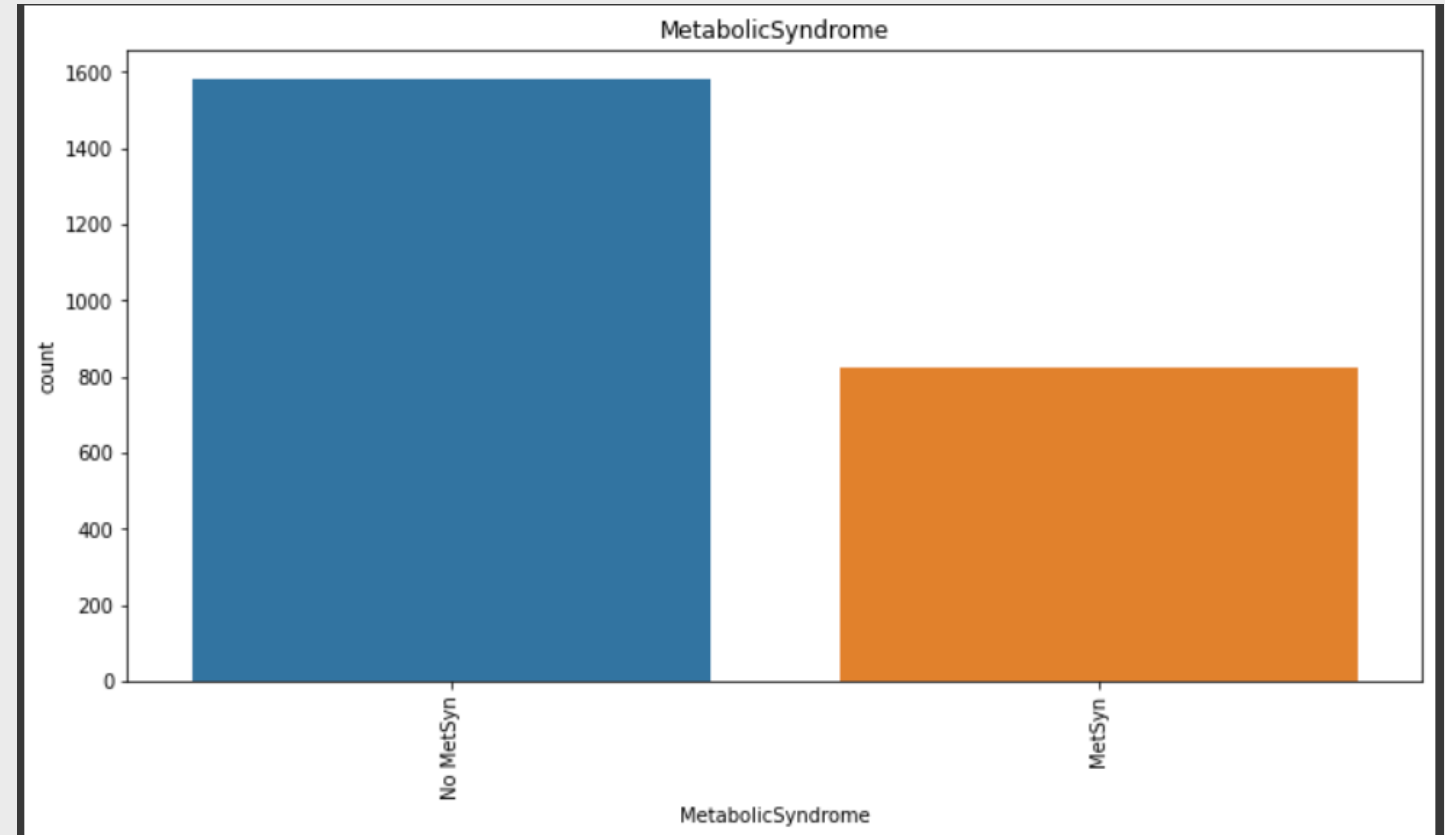

What Is Metabolic Syndrome?

- ▶ Metabolic syndrome is a group of conditions that occur together, increasing your risk of heart disease, stroke, type 2 diabetes and other serious health conditions.
- ▶ Having just one or two symptoms does not indicate the development of metabolic syndrome.
- ▶ About 1 in 3 adults in the United States have metabolic syndrome.

Problem Statement

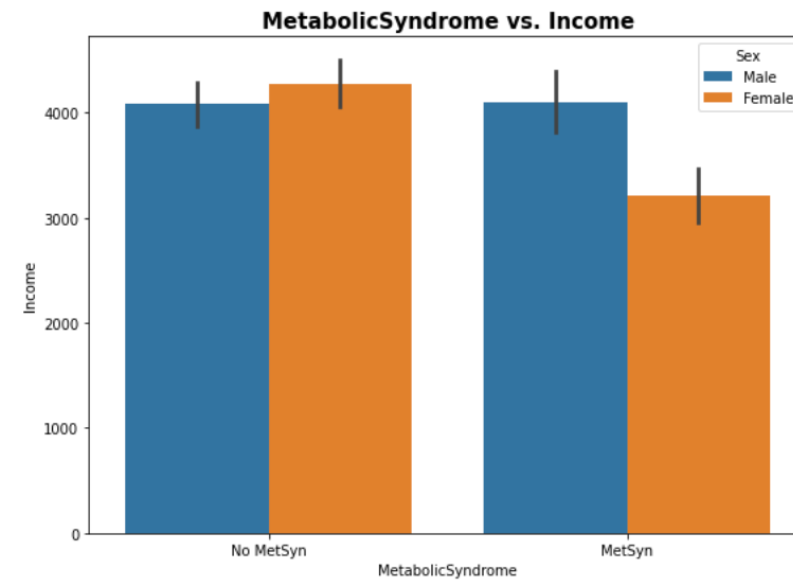

- ▶ To provide the best care, different health and demographic factors are used to create a machine learning model to predict whether a patient has developed metabolic syndrome.

Key Health Risks

Strengths

- ▶ Accurate predictions can lead to early diagnosis.
- ▶ Treatment plan can be implemented to decrease risk in developing more severe health conditions.

Limitations

- ▶ Models could not exceed 82% accuracy.
- ▶ There is an imbalance in the data.

Recommendations and Next Steps

- ▶ The first step would be to add columns to the data using feature engineering. Then tune and run the models again to try to obtain better prediction results.
